

SECTION 1

p 7 - 50

1 Optimizing availability and maintenance efficiency with vibration monitoring

- p 07
What are machine vibrations and why would you measure them?
- p 11
A brief history of vibration
- p 17
Vibration causes per wind turbine component
- p 21
Which maintenance strategy for wind turbines?
- p 29
3 ways to perform condition monitoring
- p 33
Case study Windunie: Vibration monitoring & analysis
- p 41
The importance of brand-independent vibration analysis for wind turbines
- p 45
Service and maintenance on vibration monitoring systems
- p 09
How vibration monitoring optimizes wind turbine availability and maintenance efficiency
- p 13
6 common causes of machine vibrations
- p 19
5 effects of machine vibrations
- p 27
Growing needs for a condition monitoring program
- p 31
The direct and indirect financial impact of unplanned standstill
- p 37
Vibration data analysis to unlock machine insights
- p 43
Sensor solutions for vibration measurements
- p 49
Expert considerations on automated analysis

SECTION 2

p 51 - 76

2 Machine protection with speed measurements

- p 51
What is speed and how do you measure it?
- p 55
What is the purpose of speed measurements?
- p 59
Sensor solutions for speed measurements
- p 65
What is overspeed protection?
- p 69
Voting structures
- p 73
Four reasons why overspeed protection systems should not be overly complex
- p 53
A brief history of speed measurements
- p 57
Speed-related conditions in rotating machinery
- p 63
Target objects for speed measurements
- p 67
What causes overspeed?
- p 71
Overspeed protection functions
- p 75
Service and maintenance on overspeed protection systems

SECTION 3

p 77 - 84

3 Functional Safety

- p 79
Functional Safety
- p 81
Safety Integrity Level proof tests
- p 80
Safety Integrity Level (SIL)
- p 84
Risk evaluation: Layer of protection analysis
